CERTIFICATE OF CONFORMITY

This is to certify that the items listed in this report have been uniquely identified as being present at The Brotherhood, Blacwood. All items have been tested in accordance with the Electricity at Work Regulations, 1989, and against criteria published by The Institution of Electrical Engineers, on the dates indicated. All items found to be unsafe during the course of the testing programme have been identified with a 'DANGER DO NOT USE' sticker.

1st April, 2016

PLEASE NOTE.

Every effort has been made to locate appliances due for test, however Testing Solutions accepts no responsibility for appliances which have not been made available to us. Further information regarding test criteria is available on request.

PORTABLE APPLIANCE TESTING - EXPLANATORY NOTES

Portable appliances are divided into two electrical categories, namely Class 1 and Class 2 appliances. Class 1 appliances have a functional insulation throughout, and an earth connected case. Class 2 appliances have both functional and additional insulation, ensuring that any metal parts cannot become 'live' under fault conditions.

Earth bond tests have been performed on all Class 1 appliances. This test is performed by passing a test current between the earth pin of the plug and the metal casing. Since damage may result to some IT equipment from this test, an earth screen test may have been used which allows a maximum current of 100mA to flow.

Flash tests or pressure tests have not been applied to any of the equipment tested. These tests are only recommended for equipment in an "as new" condition, and may cause damage to older appliances.

IEC leads have been tested for earth integrity, continuity, correct polarity and insulation. Extension leads with neon indicators or integral surge protection or filter networks may only have been tested for earth integrity and insulation. Extension leads with multiple socket outlets may not have been tested at all outlets and test results at the test point have been assumed to be representative of values at each outlet.

Appliances which have multiple earth points may only have been subjected to earth bond tests at one representative point. Appliances which have been 'hard wired' to a fused spur outlet have been excluded from this test programme.

The selection of retest intervals is the responsibility of the end user or duty holder. Any test interval specified in this report should be considered as advisory only. A period of at least twelve months is usually considered appropriate for most equipment. Workshop and construction site appliances and hand tools should be re-tested in three or six months. Extended test intervals may be appropriate for some IT Equipment. Fully documented visual examinations of all appliances should be carried out between full electrical tests, especially if the test interval is extended. The end user or duty holder should refer to the Code of Practice for advice on visual examination frequencies.

Pass/fail limits are based on criteria published in the "Code of Practice for In-Service Inspection and Testing of Electrical Equipment" published by The Institution of Electrical Engineers.

Every effort is made to locate appliances for test. However, we accept no responsibility for equipment which is not made available during the course of the test programme. There may be a number of appliances at the site to which this report relates which have not been tested. This may be because the equipment is redundant, damaged or about to be disposed of. It will have been ignored only under specific instruction from a responsible person.
